Dynamics and stability of a liquid-gas interface in the presence of micro-particles

This French-Japan-US collaborative study examines the influence of the micro-particles on the stability of the liquid-air interface. We will first revisit the effect of these particles on the dynamics of the interface in a confined "1D" geometry [1] with the formation of armored bubbles (fig. 1(a)) and will show that they can lead to the fingering pattern formation on a "2D" configuration (fig. 1(b)) [2]. We will then present the dynamics of a contact line impacting a single microparticle (fig. 2) or an array of micropillars [3,4].

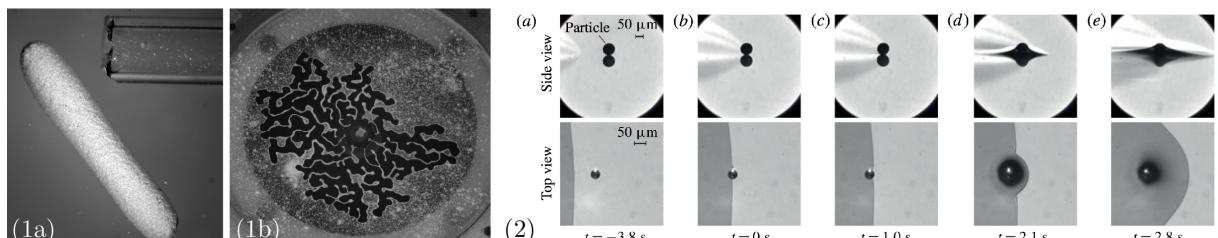

FIG. 1 : (a) An armored bubble (b) Fingering patterns in a Hele-Shaw cell. FIG. 2 : Behaviour of an advancing liquid wedge being incident on a spherical particle of diameter 50 μm .

Attention : pas de séminaire les semaines à venir : bonnes vacances

Prochain séminaire : vendredi 13 septembre 2019, Patrick Bot (Ecole Navale)
